

Problem: when the system crash or the server restarts, the docker containers exited and doesn't up automatically

Solution: run the container as a systemd service so the systemd will be responsible for running the container automatically after the system crash or restart

Steps:

1- go to this path —> /etc/systemd/system/
cd /etc/systemd/system/

2- create a service file for the container that you want

For example:

sudo vim postgres_container.service

Then write the following into the file:

[Unit]

Description=Postgres-DB Container Service

After=docker.service

Requires=docker.service

[Service]

Restart=always

ExecStart=/usr/bin/docker start -a postgres_container # is the name of the running container

ExecStop=/usr/bin/docker stop -t 2 postgres_container

[Install]

WantedBy=multi-user.target

3- save the file and exit

4- sudo systemctl daemon-reload —> to make the system see the changes of services

5- sudo systemctl enable --now postgres_container.service —> to enable and start the service
